Wings Engine Backup Manager

In Wings Engine Backup Manager various system conditions, so-called “snapshots” can be saved. This means that you can make your system settings and then create a back-up version. You can create various snapshots with different settings and quickly change over between the snapshots. It is also possible to “freeze” a system condition to ensure that any modifications are undone at the next system start and the settings correspond to the “frozen” condition.

Starting the Backup Manager

During the booting process and after displaying the bios info for three seconds the list for selecting the Backup Manager appears:

Select the **Wings Engine Backup Manager** and press **Enter** following which the Backup Manager is opened.
The system initially comes with two snapshots. A First Child which cannot be edited and corresponds to the factory setting. Derived from the First Child is the AV Stumpfl Engine Factory Image, which is the first editable snapshot.

**Creating a new snapshot**

Use Create New Snapshot to create a new snapshot. The new snapshot must refer to an existing snapshot.
Selecting a snapshot

By selecting the *Use* buttons you can choose the snapshot to be used. At the system start a Boot Manager showing the selected entry and the Backup Manager are displayed. Should you have selected a snapshot with child snapshots you are asked whether you want to create a copy of the selected snapshot or whether you want to delete all child snapshots.

![Parent Snapshot Selected]

Changing the snapshot name or description

By right-clicking the snapshot description or name you can change the description or name.
Freezing a snapshot (Disallowing modifications)

Snapshots can be frozen by clicking the Freeze checkbox. This means that any modifications in the frozen snapshot are made undone at a restart. During a Wings Engine restart the Backup Manager is started first to resume the frozen condition and only then is the system frozen again. To quit this condition you need to abort the restart in the Backup Manager and then "defreeze" the snapshot (by unchecking the box Freeze). For permanent installation this Freeze function may be quite useful to ensure that the system always starts with the same settings.

Locking a snapshot

By selecting the Lock button you can lock a snapshot. After entering a password this snapshot can no longer be selected or deleted. The snapshot can only be unlocked again by clicking the Lock button and entering the password. A locked snapshot can be recognized by the red button.

Attention: The snapshot can also be unlocked by entering the administrator password, which is “AVStumpfl” as delivered. It is therefore advisable to change the administrator password as described in the manual in item Backup Manager Administration.
Deleting a snapshot

Use **Delete** to delete snapshots that are no longer needed. If there are any snapshots that refer to the snapshot to be deleted the child snapshots will be deleted as well.

Backup Manager Administration

Click **Manage System Images** to open the administration view. Click **Import New System Image** to import new system images delivered by AV Stumpfl. Also the GUID of the Backup Manager and the operating system can be changed here. **Attention:** Changing the GUID may prevent the system from starting correctly.
The administration view is password-protected. As delivered the password is “AVStumpfl”. The password can be changed after clicking the toothed wheel.
TeamViewer Support Module

Click TeamViewer to start the TeamViewer Support Module. It allows access to the Backup Manager by AV Stumpfl after providing the TeamViewer ID to the support person. This function can only be used with a working internet connection.

Network Settings

Click Network Settings to define the network settings for the Backup Manager. These network settings refer to the Backup Manager and may differ from your system settings.
Documentation Status
